TITLE: Nonlinear theory of wings of small aspect ratio

SOURCE: IVUZ. Aviatsionnaya tekhnika, no. 2, 1966, 9-18

TOPIC TAGS: subsonic aerodynamics, compressible flow, lift, aerodynamic drag, wing tip vortex, vortex, aerodynamic pitch, rectangular wing, aerodynamic force

ABSTRACT: A method is outlined for calculating the aerodynamic properties of rectangular wings of small aspect ratio in a subsonic compressible gas flow. The nonlinear dependence of lift and pitching moment coefficients on angle of attack is taken into account, as well as the rather large critical values of 30°—40° angles of attack and the large induced drag. The method is based on a certain vortex arrangement and accounts for nonlinear effects of the angle of attack, that is, 1) the dependence on the aspect ratio of the correlation which exists between the angle formed by the wing surface and elementary vortex sheet and the angle of attack and, 2) the variation of this correlation with angle of attack and Mach number. A system of basic nonlinear algebraic equations is derived and solved by the method of successive approximations from which the strength of vortices Γ , then the coefficients of normal force, lift, and drag are calculated. The coefficient of the pitching moment

with respect to the leading edge and the distribution of the center of pressure are determined at $\alpha = 0^\circ, 10^\circ, 20^\circ$, and 30° . The results, plotted in graphs, agree well with available experimental data in a wide range of angle of attack and Mach numbers, and show that at small α they coincide with those obtained from linear theory. Reliable results can be obtained on a desk calculating machine by replacing the wing by two vortices. Orig. art. has: 6 figures and 35 formulas. [AB]

AUTHORS: Yermolenko, S.D., and Vorob'yev, N.F. (Novosibirsk)

TITLE: On agreement with experiment of characteristics of wings with finite span at supersonic velocities, computed according to the linear theory

PERIODICAL: Akademiya nauk SSSR. Institute mekhaniki. Inzhenernyy sbornik, v. 30, 1960, 131 - 138

TEXT: Many models of isolated wings of different form in plan have been tested in supersonic wind tunnels. The wing elongation λ varied between 1 and 2, and the sweepback angle X_{sr} on the line of chord centers between -40° and $+40^\circ$. All wings had the same reduction (equal to 5,82) and rhombic "supersonic" or symmetrical "infrasonic" profile with comparatively small nose radius. Relative thickness of profile $c = 10,8$ and 6 %. Tests were made according to carefully checked methods. The characteristics obtained from the experiments (continuous curves on the figures) are com-

Card 1/5

On agreement with experiment ...

pared with those of infinitely thin wings ($\bar{c} = 0$) having the same form in plan (dashed curves) computed according to the linear theory shown by Ye.A. Krasil'shchikova (Ref. 3: Teoriya kryla konochnogo razmaka v szhimayemom potoke gaza (Theory of a Wing of Finite Span in a Compressed Gas Stream), Gostekhizdat, 1952) (Case of Supersonic Leading Edge) and by U.F. Khilton (Ref. 4: Aerodynamika bol'shikh skorostey (Aerodynamics of Great Velocities), Izd-vo inostr. lit. 1955) (Case of Infrasonic Leading Edge). Three figures give the comparison of calculated and experimental characteristics of three wings at $M = 2$: with infrasonic leading edge (1-P-10), sound-velocity l.e. (6-P-10) and supersonic l.e. (10-P-10). These examples show that the calculated values of the coefficient of lifting power are larger than the experimental ones in all cases, the deviation c_y between the two values being larger for negative sweepback angles of the wing and smaller for positive angles. The calculated values of the coefficient of the longitudinal moment m_z (moments are calculated with respect to the nose of the central aerodynamical chord of the wing) at given values of the

Card 2/5

28008

D234/D306

On agreement with experiment ...

coefficient c_y are also larger than the experimental ones. The quantity $(dc_y/d\alpha)c_y = 0$ varies comparatively little with the sweep-back angle, according to both calculated and experimental data, but it increases about 28-37%. For the wings considered here the calculated values of $dc_y/d\alpha$ are about 10-20 % larger than the experimental ones. The quantity $(dm_z/dc_y)c_y = 0$ which characterizes the position of the aerodynamical focus of the wing from the nose of the central aerodynamical chord, increases smoothly when X_{sr} varies between -40° and $+40^\circ$, its increase being considerably larger for $\lambda = 1$ than for $\lambda = 1,46$ and $\lambda = 2$. The calculated values of this quantity are larger than the experimental ones, the difference being larger for negative values of X_{sr} (10 - 20 %) and smaller for positive values (up to 10%). These differences are generally explained by the fact that the calculated values of the derivatives refer to a plate ($c = 0$) and the experimental ones to wings composed of rhombic profiles with comparatively large rela-

Card 3/5

28008
S/508/60/030/000/011/013
D234/D306

On agreement with experiment ...

tive thickness ($\bar{c} = 10\%$). The investigations show that the differences between calculated and experimental data decrease when the relative profile thickness becomes smaller. To find the cause of the difference between calculated and experimental data, pressure distribution was measured on the surfaces of several models for different attack angles; results are shown on three figures). The calculated results for the front part of the wing are close to the experimental data (except for some cases referring to end sections) In the rear part of the wing the difference between experimental and calculated values of $d\bar{p}/d\alpha$ is larger, but it decreases when the relative profile thickness becomes smaller. For wings consisting of thin infrasonic profiles, the calculated values of $d\bar{p}/d\alpha$ are always close to the experimental ones, except for narrow strips at end sections and trailing and leading edge. Correspondingly, the calculated characteristics $dc_y/d\alpha$ and dm_z/dc_y in the interval $M = 1,3 \div 2,1$ investigated by the authors are closer to the experimental values than in case of thick wings consisting of rhombic profiles. There are 13 figures and 5 references: 3 Soviet-

TITLE: Calculation of downwash angles behind rectangular wings of small aspect ratio
in subsonic flow by nonlinear theory 24

SOURCE: IVUZ. Aviatsionnaya tekhnika, no. 3, 1966, 3-10

TOPIC TAGS: subsonic aerodynamics, subsonic flow, downwash, angle of attack, non-linear theory

ABSTRACT: A method is described for calculating the downwash angle, taking account of singularities of the flow over rectangular wings of small aspect ratio. The method is based on a nonlinear theory which utilizes a certain number of assumptions developed by the author (IVUZ. Aviatsionnaya tekhnika, no. 2, 1966), which makes it possible to reduce the problem to solving a system of nonlinear algebraic equations by the method of successive approximations. It is sufficient to replace the wing by two vortices in order to obtain acceptable accuracy. The downwash angle is calculated by the formula $\tan \epsilon = -U_y/(V_0 + U_x)$, where U_x and U_y are the projections of the induced velocity u at the point considered. The experimental data presented in graphs show that the method developed here makes it possible to calculate the downwash angles behind

TITLE: Salicylates of Lanthanum (Salitsilaty lantana)

PERIODICAL: Zhurnal neorganicheskoy khimii, 1959, Vol 4, Nr 2,
pp 359-366 (USSR)

ABSTRACT: The system $\text{LaCl}_3\text{-NaSal-H}_2\text{O}$ was investigated by physico-chemical methods. The formation of lanthanum salicylate was confirmed by measuring the electric conductivity. The first dissociation constant of lanthanum salicylate was calculated. The average value of K_1 is $1.5 \cdot 10^{-3}$. The thermogram of the compound was drawn by O. I. Sher. The endothermal effect at 250° corresponds to the separation of crystallization water. Two exothermal effects occur in the temperature zone $> 250^\circ$. The solubility of lanthanum salicylate in aqueous sodium salicylate solutions with concentrations of $0.1 \cdot 4 \text{ mol/l}$ is constant and amounts to $\sim 3 \cdot 10^{-5} \text{ mol/l}$. The solubility product $[\text{La}^{3+}] [\text{Sal}^{\cdot}]^3$ was determined. There are 4 figures, 3 tables, and 29 references, 17 of which are Soviet.

Zhurnal neorganicheskoy khimii, 1959, Vol 4, Nr 3,
pp 559 - 563 (USSR)

ABSTRACT:

The complexing process has been investigated by the
potentiometric method, using electrodes of the third type.
For this purpose metal electrodes $\text{Me}/\text{Me}(\text{OH})_n, \text{H}_2\text{O}, \text{H}^+$ were
subordinated to the electrodes of the third type. The
electrode $\text{H}_2/\text{H}_2\text{O}, \text{Me}(\text{OH})_n, \text{Me}^{n+}$, which is negative relative to
the metal oxide electrode, was used for investigating the
complex formation. This type of electrode is applicable only
in p_{H} -ranges in which the metal forms insoluble hydroxydes.
In investigating the complex compound in the solution the
activity of the complex and of the addenda of the ion to be

Card 1/2

The Use of Electrodes of the Third Type for
Investigating Complex Compounds

SOV/78-4-3-12/34

Investigated must be taken into account. In investigating the complex formation with the electrode of the third type the initial concentration of the complexing agent is known and the concentration of the metal in the solution can be determined by analysis. The activity of the metal ions is determined potentiometrically. The activity of the zinc, lanthanum and yttrium ions was measured with the aid of the electrodes $H_2/H_2O, Zn(OH)_2, Zn^{2+}$; $H_2/H_2O, La(OH)_3, La^{3+}$ and $H_2/H_2O, Y(OH)_3, Y^{3+}$. The results are shown in tables 1, 2, and 3. There are 3 tables and 6 references, 2 of which are Soviet.

TITLE:

The Complex Lanthanum Salicylates (Kompleksnyye salitsilaty lantana)

PERIODICAL:

Zhurnal neorganicheskoy khimii, 1959, Vol 4, Nr 6,
pp 1369 - 1376 (USSR)

ABSTRACT:

The lanthanum salicylates were investigated by the potentiometric method. Two breaks occur on the potentiometric titration curve in the case of one and two mol equivalents and one mol LaSal₃ (Fig 1). The alkali quantity which reacts with one mol lanthanum salicylates was investigated in the case of different pH-values and the results are summarized in table 1. They show that up to pH 10.5 two equivalents alkali are consumed for one mol LaSal₃. The solubility of LaSal₃ in 2.5 mol NaSal-solution in dependence on the concentration of the soda lye was investigated and the results are given in table 2. It was found that two mol soda lye to one mol LaSal₃ are necessary for the formation of soluble compounds. The addition of alkali lye to the system LaSal₃-H₂O causes a

Card 1/3

The Complex Lanthanum Salicylates

SOV/78-4-6-26/44

separation of protons under formation of $\text{Na}[\text{LaSal}^{\prime\prime}\text{Sal}_2]$; the compound $\text{Na}_2[\text{LaSal}_2^{\prime\prime}\text{Sal}]$ is produced in the case of a further addition of alkali lye. The first compound is little soluble in water, whereas the second one can easily be solved in water. The solubility of lanthanum salicylate in 2.86 n NaSal in dependence on 1 n soda lye after 40 days is given in figure 3. The dependence of the volume of the lanthanum salicylate precipitation in 2.86 n NaSal on 1 n soda lye was determined and the dissociation constants of $\text{H}_2[\text{LaSal}_2^{\prime\prime}\text{Sal}']$ were calculated. The values $K_1 = 3 \cdot 10^{-8}$ and $K_2 = 1 \cdot 10^{-10}$ were found. The complex lanthanum salicylates $\text{Na}_2[\text{LaSal}_2^{\prime\prime}\text{Sal}']$ and $\text{Na}[\text{LaSal}_2^{\prime\prime}]$ were produced in the heterogeneous system $\text{La}(\text{OH})_3\text{-NaSal-NaOH-H}_2\text{O}$. The instability constants of these complex compounds are the following: $2.7 \cdot 10^{-17}$ and $1.5 \cdot 10^{-17}$. The results of the investigation of the heterogeneous equilibrium in the system $\text{La}(\text{OH})_3$ (solid phase) - alkaline solution of sodium salicylates are given in table 4.

Card 2/3

The Complex Lanthanum Salicylates

SOV/78-4-6-26/44

The new compounds $\text{Na}[\text{LaSal}]\text{Sal}_2$ and $\text{Na}[\text{LaSal}_2]$ were isolated. The thermograms of these compounds were constructed and given in figures 5 and 6. There are 6 figures, 4 tables, and 3 references, 2 of which are Soviet.

TITLE: Basic chlorides and hydroxides of europium, terbium, and holmium

PERIODICAL: Zhurnal neorganicheskoy khimii, v. 6, no. 4, 1961, 777-782

TEXT: The basic chlorides and the hydroxides of europium, terbium, and holmium in dilute and concentrated solutions were determined potentiometrically by a method described previously (Ref. 3: N. V. Aksel'rud, V. B. Spivakovskiy. Zh. neorg. khimii, 2, 2709 (1957)). The composition and product of activity of these basic salts and hydroxides of europium, terbium, and holmium were determined. From these data, the authors calculated the standard free energy. In the range of chlorine activity studied, the europium and holmium systems form basic salts of formula $M(OH)_2Cl$, the terbium system, in addition to the latter type of salt, forms also a basic chloride of formula $Tb(OH)_{2.5}Cl_{0.5}$. The products of activity (L) of the basic chlorides of type $M(OH)_2Cl$ were calculated

Card 1/4

by the equation $\log L = \log a_{M^{3+}} + 2 \text{ pH} - 28$ from data on the equilibrium activity of the metal and chloride ions and the pH value of the solution. Aging processes in these compounds and changes in the composition and products of activity were studied as a function of time. Within 150 days the basic salts of all three systems had transformed to hydroxides. The composition of the solid phases depends not only on the composition of the solution, but also on the duration of the transformation process. Hydroxides are formed with decreasing activity of the ions and further aging of the system. Table 4 represents the products of activity and standard free energies for the formation of basic chlorides and hydroxides of europium, terbium, and holmium. The authors studied the dependences of the products of activity of the basic salts and hydroxides on the chlorine ion activity and found that they differed in character: The product of activity of the basic chlorides drops with lowered chlorine ion activity, while the products of activity of the hydroxides increase. There are 4 tables and 4 references: 3 Soviet-bloc and 1 non-Soviet-bloc.

TITLE: Neodymium hydroxybenzoates

SOURCE: Zhurnal neorganicheskoy khimii, v. 9, no. 1, 1964, 48-55

TOPIC TAGS: neodymium salicylate, neodymium hydroxybenzoate, neodymium parahydroxybenzoate

ABSTRACT: It is assumed that neodymium hydroxybenzoates have properties similar to those of lanthanum salicylate although there are, no reported studies to substantiate this assumption. Thus, tests were made here on their electroconductivity, precipitation volume, solubility, thermography and methods of preparation. The difference in action of salicylic and parahydroxybenzoic acids was investigated to find the role of the chelate groups of salicylic acid in the formation of complex compounds. The above methods showed the formation $\text{NdSal}_3 \cdot \text{H}_2\text{O}$ and $\text{Nd}(\text{C}_7\text{H}_5\text{O}_3)_3$ and the dissociation constants of

Card 1/2

ACCESSION NR: AP4009346

neodymium salicylate were calculated as $K_1 = 1.4 \cdot 10^{-3}$, $K_2 = 1.3 \cdot 10^{-2}$, $K_{gen} = 7.4 \cdot 10^{-8}$ at 25°C and ionic force $3 \cdot 10^{-3}$. The solubility of neodymium salicylate in water and sodium salicylate at 25°C has been studied and the solubility product determined as $1 \cdot 10^{-11}$. Increasing solubility of neodymium parahydroxybenzoate in excess ligand is due to the acicular coordination type of this compound permitting a fourth ligand to penetrate into the interior sphere. The heat stability of neodymium and sodium salicylates has also been studied. Separation of salicylic acid by heat is explained by the formation of intracomplex compounds. Basic neodymium salicylates $Nd(OH)Sal_2$ and $Nd(OH)Sal_3$ have been isolated and their greater stability as compared to the basic neodymium parahydroxybenzoates has been established by the method of potentiometric alkali titration. TITLE: Neodymium salicylates

SOURCE: Zhurnal neorganicheskoy khimii, v. 10, no. 12, 1965, 2617-2629

TOPIC TAGS: neodymium compound, rare earth element, salicylic acid, chemical reaction

ABSTRACT: Neodymium oxide was dissolved in a measured quantity of hydrochloric or perchloric acid. Neodymium salicylate was obtained by mixing equivalent amounts of aqueous solutions of neodymium chloride and sodium salicylate, filtering the precipitate, washing it with water, acetone and ether, and drying it for 6 hours at 85°C. The investigation used the methods of measurement of solubility and electrical conductivity, potentiometric titration with alkali, extraction, third-order electrodes absorption spectra, as well as measurement of density. From data on the solubility of neodymium silicate in sodium salicylate at 25°C and an ionic strength of I = 1, the fourth instability constant for the complex neodymium silicate $NdSal_4^-$, was calculated as $K_4 = 0.14$. In methyl alcohol the solubility of neodymium depends strongly on the concentration of salicylic acid. The electrical conductivity of neodymium

salicylate in methyl and n-butyl alcohol was studied as a function of the dilution and the dissociation constants were calculated as $K_1 = (2.4 \pm 1.0) \times 10^{-5}$ in methanol and $K_1 = (1.0 \pm 0.5) \times 10^{-5}$ in n-butanol at 25°C and an ionic strength of 0.001. The distribution constant of neodymium salicylate between pure tributyl phosphate and a 0.10 molar aqueous solution of sodium salicylate was found to be equal to 100 at 20°C. Orig. art. has: 6 formulas, 6 figures, and 8 tables.

TITLE: Calculation of the instability constants from data on the electric conductivity		
SOURCE: AN UkrSSR. Dopovidi, no. 1, 1966, 85-89		
TOPIC TAGS: electric conductivity, stability constant, chemical stability, metal compound, rare earth element		
ABSTRACT: A method is proposed for calculating the instability constants of complex compounds from data on the electric conductivity of isotonic metal-ligand series. For the ions of metals for which there is no reversible electrode in systems which are not covered by ligands, measurement of the electric conductivity is an effective means of obtaining initial data for the calculation of the instability constants of the complex compounds. The method is verified using as an example complex compounds of rare-earth elements with sulfate and chromate ions. The possibility is discussed of calculating the mobility of complex ions for known constants of instability and of obtaining qualitative characteristics of the construction of the complex ion. The instability and mobility constants of complex ions of sulfosalicylate of neodymium were calculated with a computer in accordance with a program prepared on the basis of the analysis. This report was presented by Academician AN UkrSSR K. B. Yatsy-myrs'kyj (K. B. Yatsimirskiy). Orig. art. has: 3 figures, 3 formulas, and 2 tables.

Ostankino, N.Y., Director
Conference on the Results and Prospects of the Development of
Soviet Relay Construction
Moscow, 1955, Fr. 10, pp. 66-67 (RUSS)

An All-Union Scientific-Technical Conference was held at the beginning from July 7 to 11, 1955, in Moscow during the last five years. Participants in relay construction during the last five years, particularly the prospects of the further development of relay construction, and the protection and automation of electrical installations were utilized. The Conference was attended by representatives of scientific research institutes, planning organizations and colleges, special laboratories, planning organizations of the Soviet Union (All-Union Main Bureau of Electrification), and a number of power systems. The representative of the Electrotechnical Industry Bureau (Chairman of the Electric Department) M. M. Delyuk and M. A. Tikhonov reported on the achievements and problems of the plant in the manufacture and the development of new highly sensitive and high-speed relays and protective devices. V. I. Fabrikant, Candidate of Technical Sciences, spoke

Chairman of the Presidium, "Relay Construction". Professor G. S. Kostylev, Doctor of Technical Sciences, spoke about the development of relay construction in a tour to the United States and delivered a speech on the development of relay construction in the United States. Professor G. S. Kostylev spoke about the work of the Institute of Gasification, Electrifying Central Circuits and Relay Protection. Dr. V. I. Shchegolev, Candidate of Technical Sciences, spoke about the work of the VNIIT for the development of relay units. Dr. B. S. Savchenko, Candidate of Technical Sciences, delivered a speech on the Usefulness of Developing Protective Devices With a Sensitive Electromechanical Element. Professor G. S. Kostylev, "Prospects of the Development of Relay Protection With Semiconductor Diodes". Professor L. A. Grishchuk, who conducted large-scale research on the development of the magnetic and power relays, spoke about the prospects of further development of relay construction, spoke about the prospects of further employment of solid-state elements in relay construction. The manufacture of large solid-state elements is underway by the Shchelkovo plant, and related enterprises are sharply criticized. The Conference pointed out that automatic frequency- and power controllers,

changed installations for excitation and power control, standard automatic regulators, and automatic regulators for the bettering of electric consumers which are indispensable in the full automation of electric installations have not yet been provided for in the Soviet automotoric program.

ABSTRACT: B. S. Uspenskiy was born in June 1906. He graduated from the State Electric Machine Building Institute in 1928 as an electric installation engineer. He worked in the State Electro-Technical Trust for four years, then in the All-Union ElectroTechnical Union, where he planned power construction units. Plans which he made up at that time for the electrical portion of electrical stations and sub-stations are still being used. He was involved in planning and installation of the electrical portion of hydro-electric power stations and powerful pumping stations in the Moscow-Volga Canal. During the war, he was in charge in installation of the Krasnogorskaya Heat and Electric Power Station, the planning of the Urals Hydro-Electric Power Station and other projects. He

Title : Ecological and Faunistic Review of Hornets (Hymenoptera, Siricidae)
in the Soviet Carpathians. (Ecologo-faunisticheskiy obzor
rogokhvostov Sovetskikh Karpat.)

Orig Pub : Nauk. zap. Kiivs'k un-t, 1956, 15, No 11, 83-91

Abstract : Seven species of hornets were found in Soviet Carpathians.
The alder (*Xiphydria corylus* L.) and the big birch (*Tremex fuscicornis* F.) hornets were widely distributed Eurasian
species; the first one was adapted in the Carpathians to alder
valley forests, the second to the belt of broad-leaved forests.
Sirex gigas L., *Feururus juvencus* L., *Xeris spectrum* L. and
Xanthosirox tardigredus Ced.-- were typical coniferous forest
species, inhabitants of Euro-Siberian taiga and of mixed forests.
In the Carpathians they were found under conditions of dark

coniferous mountain forests. The discovery of a trigr species *X. tardigradus* considerably to the south-west of the former boundaries of the area of habitation was interesting. The pine hornet (*S. rugos Klug*) was a mountain forest species of the ancient tertiary alpine mountain fauna complex. In the Drogobych region this species reached, apparently, the extreme north-eastern boundaries of its distribution. A change in the special feeding habits of beetles in various parts of the area, conditioned by the occurrence of various species of feeding plants, was observed. Two new varieties of hornets: *S. gigas* var. *montana* nov. and *S. rugos* var. *pellida* nov. were described.

TITLE: A Swimming Crab (Krab - plavunets)

PERIODICAL: Priroda, 1957, # 12, p 115-116 (USSR)

ABSTRACT: The Black Sea swimming crab (*Portunus holeatus* Fabr.) lives in the sands of the Black Sea shore. It is only 30 mm long and can swim by using its ear-shaped hind legs. The author reports that on several occasions he had noted crabs of this species sitting in the skin folds of a swimming medusa (*Rhizostoma pulmo*). They seem to use the jellifish as their protector and as a means of transportation for being carried over long distances.
There is one photo and one Slavic (Russian) reference.

SOURCE: Elektricheskiye stantsii, no. 5, 1965, 93

TOPIC TAGS: electric engineering, electric engineering personnel

ABSTRACT: An engineer since 1929, A. B. Chernin has worked for years in developing new techniques and equipment for relay protection of electric power systems. In this 60th birthday tribute, he is credited with leading the group which produced the directives on relay protection, contributing to the development of a method for calculating transient processes in long distance 400-500 kv power transmission lines and with aiding in planning of the electric portions of power stations, substations and power systems. The results of his engineering and scientific work have been published 46 times, he is a doctor of technical sciences (since 1963), and has taught for 30 years at the Moscow Power Institute. TITLE: Determination of the heats of formation for indium phosphide and gallium phosphide by means of combustion in a calorimeter

SOURCE: Khimicheskaya svyaz' v poluprovodnikakh i tverdykh telakh (Chemical bond in semiconductors and solids). Minsk, Nauka i tekhnika, 1958, 128-129

TOPIC TAGS: heat of formation, indium compound, gallium compound, calorimeter, heat measurement

ABSTRACT: The present study was made in view of the lack of reliable data on the heats of formation for InP and GaP. High purity phosphides synthesized by the Institute of Solid State Physics and Semiconductors of the AN BSSR were burned under pressure of oxygen in the calorimeter. The respective heats of formation obtained in a series of combustion experiments are: $\Delta H_{298}^{\circ} = -29.1 \pm 2.5$ kcal/mol for GaP and $\Delta H_{298}^{\circ} = 21.5 \pm 1.5$ kcal/mol for InP. TITLE:

Station for measuring variations of the earth's na-
tural electromagnetic field in the range 0.5-1000 c/s

PERIODICAL:

Referativnyy zhurnal, Geofizika, no. 7, 1962, 34, ab-
stract 7A221 (V sb. Vopr. teorii i praktiki elektro-
metrii, M., AN SSSR, 1961, 56-68)

TEXT: Equipment with a low noise level has been created to measure
electromagnetic field variations with an amplitude to $10 \mu\text{v}$ in the
magnetotelluric method. The station's frequency range of 0.5 -
1000 c/s is broken into three bands: 0.5 - 10, 10 - 100, and 100 -
1000 c/s. The frequency characteristic of each band is flat. The
amplifiers of each channel are charged by NO6-12(POB-12) loop-os-
cillograph galvanometers. Three components -- the horizontal and
the vertical for the magnetic field, and the horizontal for the
electric field -- can be recorded simultaneously. The oscillograph's

Card 1/2

Station for measuring ...

S/169/62/000/007/079/149

sensitivity is not below 20 mm/ μ v on each band. There are tube amplifiers with a set of filters and output attenuators that weaken the signal by 100-fold. Provision is made for the possibility of visually controlling the signal from the scale of a M-24 (M-24) ammeter. In the station there is a low-frequency calibration generator, permitting the supply to the amplifiers' inputs of sinusoidal voltage, of a definite amplitude and frequency. The results of testing the station in different areas confirm that for prospecting purposes it is expedient to study the natural electromagnetic field in the range 0.5 - 1000 c/s. / Abstracter's note: Complete translation. 7 (X)
